At the Shika nuclear power station, the radiation environment is reducing with the suspension of the long-term plant, so there is concern that the consciousness and susceptibility of workers' exposure to radiation reduction will be decreased.

Therefore, the utility and partner companies are implemented on activities to raise awareness of various exposure reduction awareness raising activities and understanding on radiation protection. And, we are hosting study meetings for utility employees who have not experienced a high dose environment during plant operation and a high contamination environment in outages.

These are to allow workers to work safely and smoothly in a high dose / high contamination environment even when the plant will be in operation in the future.

In this presentation we will introduce the contents and issues of ALARA activities we are currently conducting at Shika Nuclear Power Station.
